Database Management Systems

Mini Project Report on

"Movie Ticket Booking System"

Submitted in partial fulfillment of the requirements for the award of the degree of

Bachelor of Engineering

in

Artificial Intelligence & Machine Learning

Submitted by

Dhananjay

Kumar

1BI20AI009

Under the Guidance of

Prof. Sahana M.
Assistant Professor
Department of AI&ML, BIT
Bengaluru-560 004

Department of Artificial Intelligence & Machine Learning
Bangalore Institute of Technology
K.R. Road, V.V. Pura, Bengaluru-560 004

VISVESVARAYA TECHNOLOGICAL UNIVERSITY
"Jnana Sangama", Belagavi-590018, Karnataka

BANGALORE INSTITUTE OF TECHNOLOGY
Bengaluru-560 004

Department of Artificial Intelligence & Machine Learning

Certificate

This is to certify that the Database Management Systems mini project work entitled "Laptop Rental Management System" carried out by Mr.Dhananjay Kuamr 1BI20AI009 a bonafide student of V semester B.E. for the partial fulfillment of the requirements for the Bachelor's Degree in **Artificial Intelligence & Machine Learning** of the **VISVESVARAYA TECHNOLOGICAL UNIVERSITY** during the academic year 2022-23. It is certified that all corrections/suggestions indicated for Internal Assessment have been incorporated in the report deposited in the departmental library. The mini project report has been approved as it satisfies the academic requirements in respect of Mini Project work prescribed for the said degree.

Prof. Sahana M.	Dr. D.G Jyothi	Dr. Ashwath M.U.
Assistant Professor	Professor & HoD	Principal
Dept. of AI&ML	Dept. of AI&ML	BIT
BIT, Bengaluru.	BIT, Bengaluru.	Bengaluru.

ACKNOWLEDGEMENT

The knowledge & satisfaction that accompany the successful completion of any task would be incomplete without mention of people who made it possible, whose guidance and encouragement crowned our effort with success. We would like to thank all and acknowledge the help we have received to carry out this mini project. We would like to convey our thanks to the Principal **Dr.Aswath.M.U** and Head of Department **Dr.Jyothi.D.G** for being kind enough to provide the necessary support to carry out the mini Project.

We would also like to acknowledge the support we have received from the mini project coordinators **Prof. Sahana M** and **Prof. Shruthiba B** for understanding the requirements to be met at each phase of the mini project.

We are most humbled to mention the enthusiastic influence provided by our guide **Prof. Sahana M** on the mini project for the ideas, time to time suggestions for being a constant support and co-operation showed during the venture and making this mini project a great success. We would also take this opportunity to thank our friends and family for their constant support and help.

We are very much pleasured to express our sincere gratitude to the friendly co-operation showed by all the staff members of Artificial Intelligence and Machine Learning Department, BIT.

ABSTRACT

The Online Management System is being developed for customers so that they can book movie tickets from any part of the world. This application takes information from the customers through filling their details. A customer being registered in the website has the facility to book a movie tickets which he/she requires. It is an online system through which customers can view available movie shows, register and book movie tickets. We developed this project to book a movie ticket at the fare charges. In present system all booking work done manually and it takes very hard work to maintain the information of booking and movies. If you want to find which movie is available for booking, then it takes a lot of time. It only makes the process more difficult and hard. This aim of the project is to automate the work performed in the online movie ticket booking management system like records of movie tickets, tickets available for booking, booking charges for movies, store records of the customer. Online movie ticket bookng Management System is a movie ticket booking software that provides a complete solution to all your day-to-day movie ticket booking office running needs. This system helps you to keep the information of customer online. You can check your customer information any time by using this system. Online movie tickets management system is a unique and innovative product. Based on this information you can take decision regarding your business development.

Chapter 1

Introduction

1.1 Introduction to Project

A online ticket booking management database project involves creating a database to store information about movie shows that are available for booking, as well as information about the customer transaction. The database would likely include tables for movies, customers, booking transactions, and possibly other relevant information such as movie rates and about the theater. The project would also involve developing a user interface for entering and retrieving information from the database, as well as for managing and analyzing the data. Depending onthe scope of the project, it may also include features such as automated billing and inventory tracking. A online ticket booking management system is a software application that is used to manage the online ticket booking of the movies. It is designed to automate the process of online method. The system allows customers to reserve seats online, track their tickets with sow dates, and make payments. It also allows the theater to arrange different movie show times, track rental income, and generate reports on rental activity. The system typically includes a database to store information about the movies, customers, and online ticket booking transactions. It also includes a user interface that allows customers to view the available movie shows, make a reservation, and view their booking history for particular users. Additionally, the system includes features such as automated billing, inventory tracking, and reporting. The system can be used by a wide range of businesses, such as online movie ticket booking with snacks for the interval, event planners, and educational institutions. It allows them to manage their inventory of movies, track ticket booking income, and provide a convenient service to customers. It can also help to reduce the administrative burden . Overall, online movie ticket booking management system is a useful tool for businesses that movie theaters, it can help them to streamline the booking system and increase theirefficiency, and provide a convenient service to their customers.

Chapter 2

System Analysis

2.1 Proposed System

To produce a web-based system that allow customer to register and reserve movie tickets online and for the theaters to effectively manage their movie collections business. To ease customer's task whenever they want to book a movie ticket. As all the system is computerized, first of all customer must fill details of their own and pay the required amount. So, the paperwork is not too lengthy.To make sure a user gets his desired movie planned as early as possible. The online movie ticket booking system will provide a faster response to complete the process. It is an online system through which customers can view available movies, register and book movie. I developed this project to booka movie on book at the fare charges. In present system all booking work done manually and it takes very hard work to maintain the information of booking and movies. If you want to find which movie is available for booking, then it takes a lot of time. It only makes the process more difficult and hard. This aim of the project is to automate the work performed in the online movie ticket booking management system like records of booking, movies available for booking, booking chargesfor movies, store records of the booking.

2.2 Objective of Project

This study main objective is to focus on solving societal problems.
The objective of this initiative is:

- To understand the problems and struggles faced by the rural people and poor literates in movie booking servcie.
- To produce a web based system that allow customer to register and reserve movie ticketsonline and for the company to effectively manage their online movie ticket booking business.
- To ease customer's task whenever they need to book a movie ticket.
- To establish a system of movie ticket services available to each and every person.
- To find a simple way in providing an efficient method of movie ticket booking.

Chapter 3

System Requirements Specification

3.1 Specific Requirements

The specific requirements of the Laptop Rental Management system as follows:

3.1.1 Hardware Requirement

The section of hardware configuration is an important task related to the software development insufficient random-access memory may affect adversely on the speed and efficiency of the entire system. The process should be powerful to handle the entire operations. The hard disk should have sufficient capacity to store the file and application and these are the hardware requirements needed:

- Processor : Intel i3/i5/1.8GHz machine or above
- Primary Memory : Minimum 2 GB RAM capacity
- Hard disk : 1TB or greater
- Cache Memory : L2-1 MB
- CPU : Intel HD Graphics

3.1.2 Software Requirement

A major element in building a system is the section of compatible software since the software in the market is experiencing in geometric progression. Selected software should be acceptable by the firm and one user as well as it should be feasible for the system. The software requirements are as follows:

- Operating System : Windows 7 or higher
- Front End : HTML5, CSS3, JavaScript
- Back End : PHP, SQL
- Frame work : Bootstrap
- Software : Visual Studio Code, XAMPP

3.2 About Technologies used

- **HTML** is integrated in **PHP**. It provides a means to structure text-based information in a document. It allows users to produce web pages that include text, graphics and hyperlinks.
- **CSS (**Cascading Style Sheets) is a style sheet language used for describing the presentation of a document written in a mark-up language. Although most often used to set the visual style of web pages and user interfaces written in HTML and XHTML, the language can be applied to any XML document.
- **MYSQL** is the language used to manipulate relational databases. It is tied closely with the relational model. It is issued for the purpose of data definition and data manipulation. Program runs as a server providing multi-user access to a number of databases. MySQL is a multithreaded, multi-user SQL database management system (DBMS). It includes facilities to add, modify or delete data from the database, ask questions (or queries) about the data stored in the database and produce reports summarizing selected contents.
- **PHP** is a scripting language originally designed for producing dynamic web pages. It has evolved to include a command line interface capability and can be used in standalone graphical applications. PHP is a general-purpose scripting language that is especially suited for web development. PHP generally runs on a web server, taking PHP code as its input and creating web pages as output. It can also be used for command-line scripting and client-side GUI applications. PHP can be deployed on most web servers, many operating systems and platforms, and can be used with many relational database management systems. It is available free of charge, and the PHP Group provides the complete source code for users to build, customize and extend for their own use. PHP stores whole numbers in a platform-dependent range. This range is typically that of 32-bit signed integers. PHP has hundreds of base functions and thousands more from extensions. These functions are well documented on the PHP site.

Chapter 4

System Design

4.1 Database Design

The database is designed with the following modules.

1. **Register Module:**

   When the user opens the site welcome message is displayed and the application prompts the user to login or register. The user needs to provide their first name, last name, email, license number, phone number, password, confirm password, gender for registration. These details will be stored in database.

2. **Login Module:**

   Here the user gets registered with application with a simple mail id and password. No further details are asked unless the user rents any laptop device in the application avoiding annoying experience to the users. For login user will input their email and password. Admin will provide their admin id and password which will compared with a database content.

3. **Booking Module:**

   In order to book a ticket, the user must select the date and time of movie screening and simultaneously confirming the location of the theater. The booking details of movie are displayed. User can select their preferred movie and book for the same through the booking page.

4. **Payment Module:**

   User should able to make payment by filling card number, expiry date and CVV . All the details Entered must be correct and entering any kind foul information may lead to payment failure. Once the payment done then user can see their booking status on their profile.

5. **Logout Module:**

   The system allows user to logout from their dashboard once the booking or viewing of the laptops is done. The system also allow admin to logout from admin dashboard, after any functionalities done by the admin.

4.2 ER Diagram

An entity–relationship model is usually the result of systematic analysis to define and describe what is important to processes in an area of a business. An E-R model does not define the business processes; it only presents a business data schema in graphical form. It is usually drawn ina graphical form as boxes (entities) that are connected by lines (relationships) which express the associations and dependencies between entities.

An ER model can also be expressed in a verbal form, for example: one building may be divided into zero or more apartments, but one apartment can only be located in one building. Entities may be characterized not only by relationships, but also by additional properties (attributes), which include identifiers called "primary keys". Diagrams created to represent attributes as well as entities and relationships may be called entity-attribute-relationship diagrams, rather than entity-relationship models.

Consequently, the ER model becomes an abstract data model that defines a data or information structure that can be implemented in a database, typically a relational database.

The main components of ER model are: entity set and relationship set. Here are the geometric shapes and their meaning in an ER Diagram

Rectangle : Represents Entity sets.

Ellipses : Attributes.

Diamonds: Relationship set

Lines : They link attributes to Entity Sets and this to Relationship Set.

Fig no: 4.1 is the ER diagram of “Laptop Rental Management System” with entities Admin, Movies, Users, Bookings, Payments.

4.2.1 ER Diagram

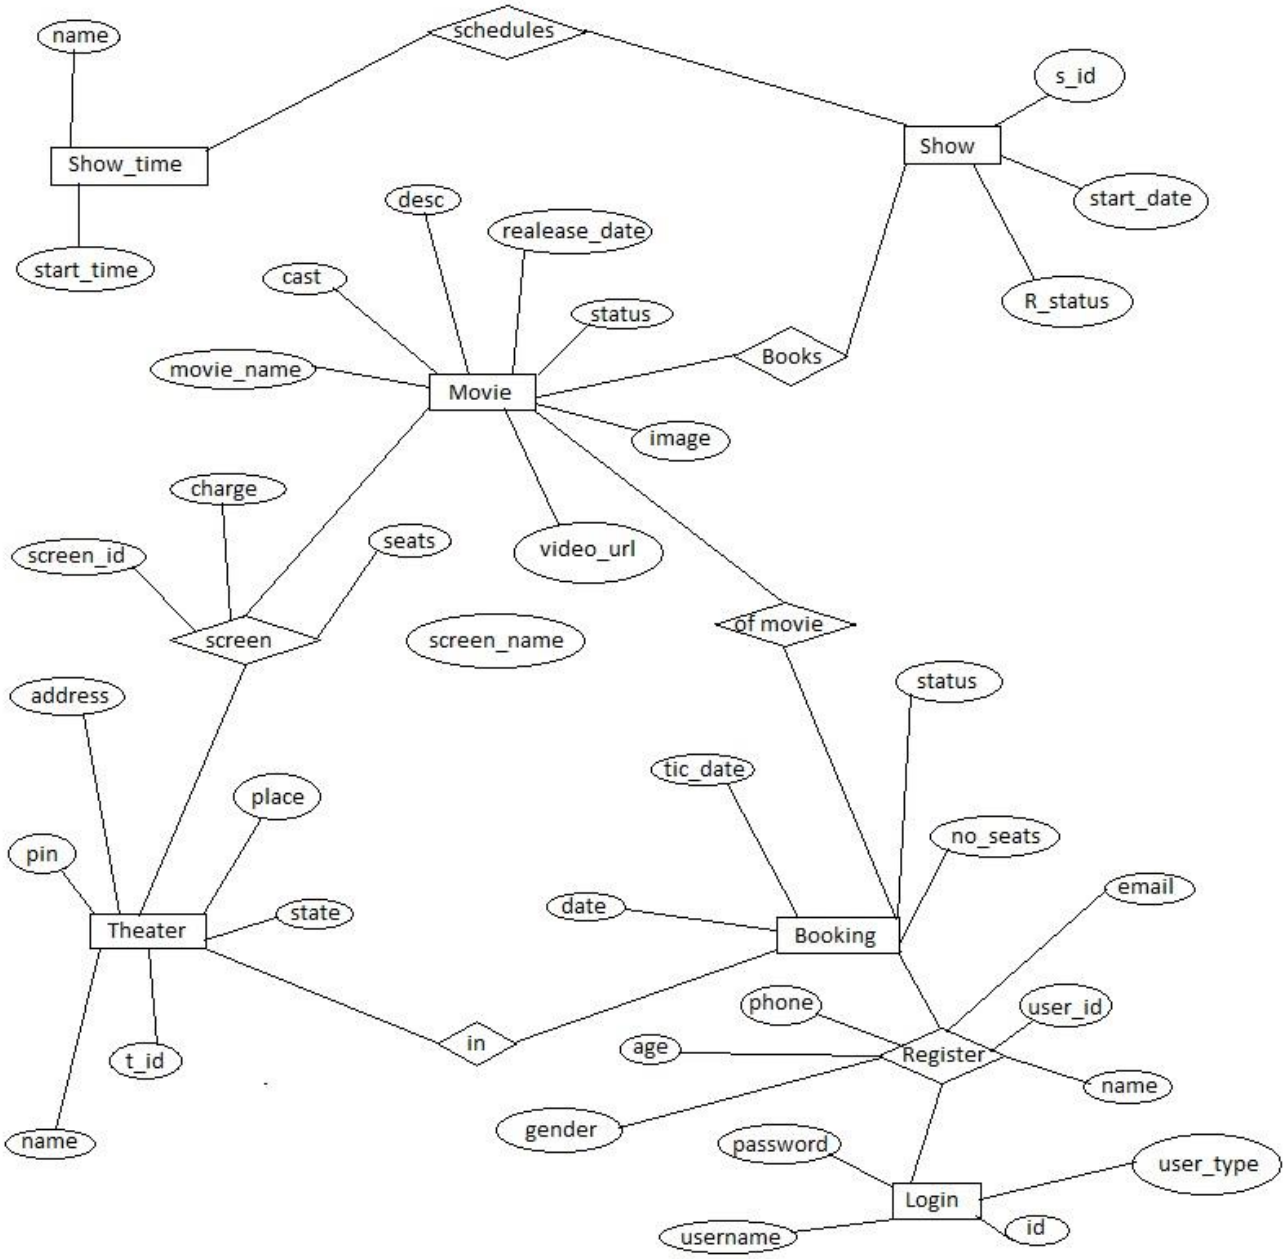

Fig.4.1: ER Diagram of Online Movie ticket booking Management System

4.3 Schema Diagram

A database schema is the skeleton structure that represents the logical view of the entire database. It defines how the data is organized and how the relations among them are associated. It formulates all the constraints that are to be applied on the data. A database schema defines its entities and the relationship among them. It contains a descriptive detail of the database, which can be depicted by means of schema diagrams.

Entity

In a database management system (DBMS), an entity is a piece of data that is stored in the database. An entity can be a person, place, thing, or even an event. There are two types of entities in DBMS: strong and weak. For example: laptops, users, bookings, payments.

Attribute

An Attribute represents the properties of real-world objects that are relevant for the application purposes. Attributes are associated with the concept of Entity, with the meaning thatall the instances of the entity are characterized by the same set of attributes. In other words, theentity is a descriptor of the common properties of a set of objects, and such properties are expressed as attributes.

Relationship

A Relationship represents semantic connections between entities, like the association between an artist and his/her album, or between an artist and his/her reviews. The possible values are one and many. Based on their maximum cardinality constraints, relationships are called

- "one-to-one", if both relationships roles have maximum cardinality 1,
- "one-to-many", if one relationship role has maximum cardinality 1 and the other role has maximum cardinality N,
- "many-to-many", if both relationships roles have maximum cardinality N.

4.3.1 Mapping of ER Diagram to Schema Diagram

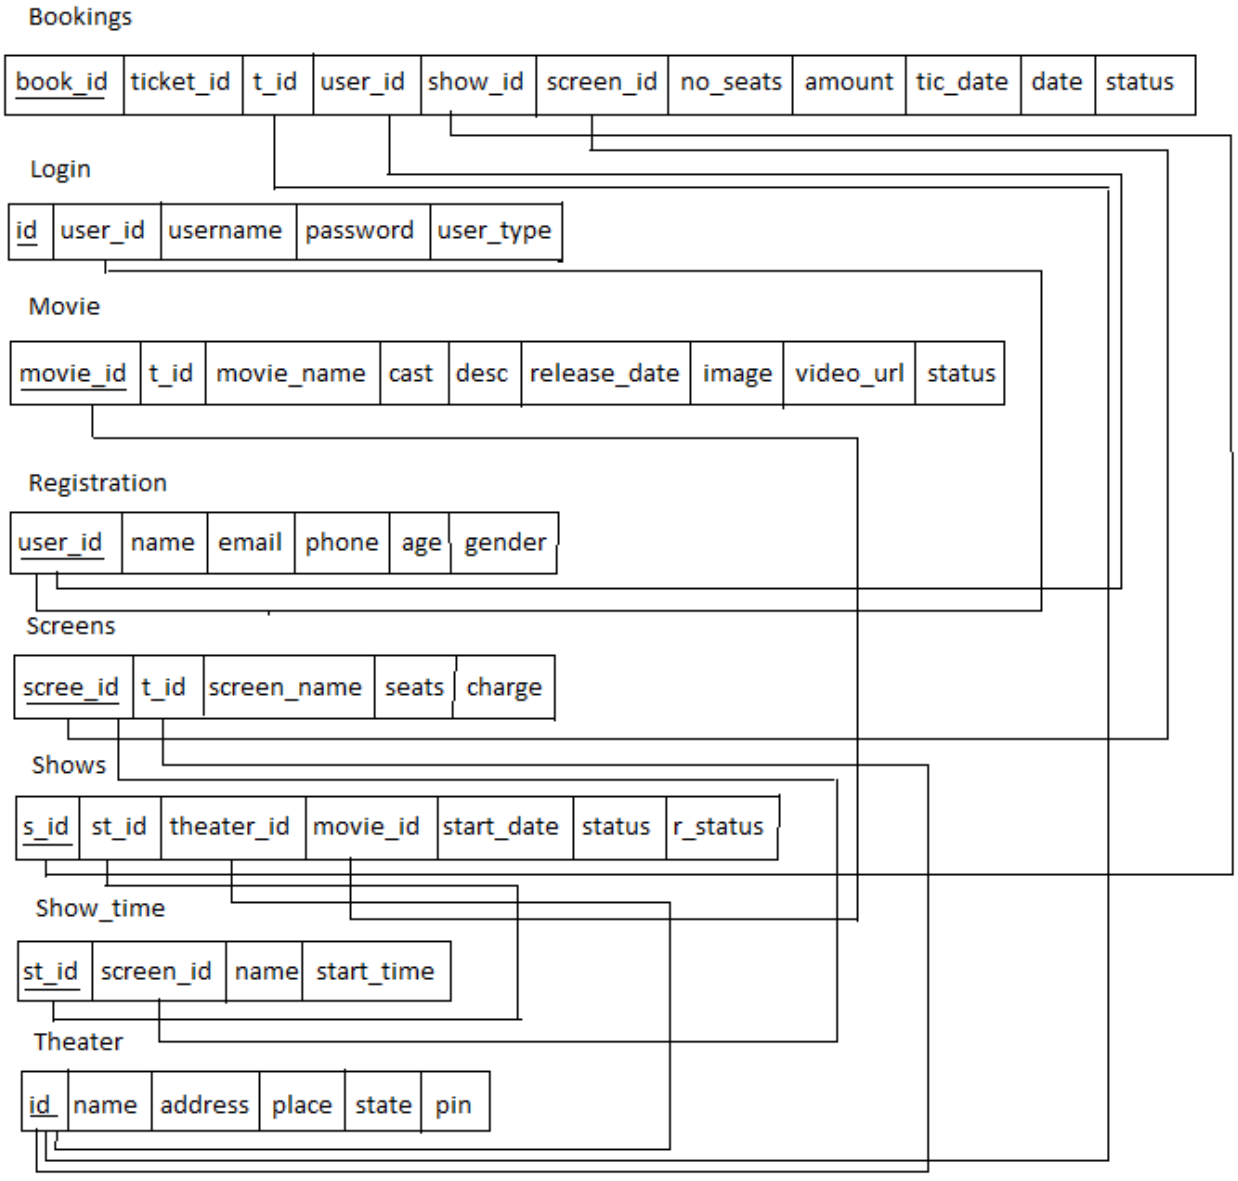

Fig. 4.2 Schema diagram of Laptop Rental Management System.

4.4 Implementation

PHP: Hypertext Pre-processor (or simply PHP) is a server-side scripting language designed for web development, and also used as a general-purpose programming language. PHP code may be embedded into HTML code, or it can be used in combination with various web template systems, web content management systems, and web frameworks. PHP code is usually processed by a PHP interpreter implemented as a module in the web server or as a Common Gateway Interface (CGI) executable. The web server combines the results of the interpreted and executed PHP code, which may be any type of data, including images, with the generated web page. PHP code may also be executed with a command-line interface (CLI) and can be used to implement standalone graphical applications. This project uses HTML as front-end tool. Hypertext Mark-up Language (HTML) is the standard mark-up language for creating web pages and web applications. With Cascading Style Sheets (CSS) and JavaScript, it forms a triad of cornerstone technologies for the world wide web. Web browser receive HTML documents from a web server or from local storage and render the documents into multimedia web pages.HTML describes the structure of a web page semantically and originally included cues for the appearance of the document.HTML elements are the building blocks of HTML pages. With HTML constructs, images and other objects such as interactive forms may be embedded into the rendered page.HTML provides a means to create structured documents by structural semantics for text such as headings, paragraphs, lists, links, quotes and other items.HTML elements are delineated by tags, written using angle brackets. Browsers do not display the HTML tags, but use them to interrupt the content of the page.

4.4.1 Tables Description

The Database consists of five tables:

1. BOOKINGS: It stores the details of all the bookings.
    - BOOK_ID : Booking unique id.
    - T_ID: Theater unique id.
    - USER_ID:User unique id.
    - SHOW_ID:Show unique id

- SCREEN_ID:Theater screen unque id
- No_SEATS: no of seats booked
- AMOUNT:Amount paid for booking
- TICKET_DATE:Movie date
- STATUS:Confirmation of ticket

2. LOGIN: It stores the details of user.
    - ID: Login unique Id
    - USER_ID: User unique id.
    - USERNAME: Name of the user.
    - PASSWORD: Password of user.

3. MOVIE: It give the booking details for user.
    - MOVIE_ID:Movie unique Id.
    - T_ID: Theater unique id.
    - MOVIE_NAME: Movie Name.
    - CAST: Movie Cast.
    - DESC: Movie description.
    - RELEASE_DATE: Movie Release date
    - IMAGE:Movie Poster link
    - VIDEO_URL:Movie Trailer link

4. REGISTRATIONS:It gives all the registration details.
    - USER_ID:User unique id.
    - NAME:User Name.
    - EMAIL:User email id.
    - PHONE: User Phone number
    - AGE:User age.
    - GENDER:User gender.

5. SCREEN:It gives the theater screen details
    - SCREEN_ID:Screen unique id.

- T_ID:Theater unique id.
- SCREEN_NAME:Screen name.
- SEATS:No of seats for the screen.
- CHARGE :Charge for the screen

6. SHOWS:It gives all the shows available
    - S_ID:Show unique id.
    - THEATER_ID:Theater unique id.
    - MOVIE_ID:Movie unique Id.
    - START_DATE.Movie time.
    - STATUS:Confirmation of ticket
    - R_STATUS:Show status

7. SHOW_TIME:It gives timings of all the shows available.
    - ST_ID:Show time unique id.
    - SCREEN_ID:Screen unique id.
    - NAME:Show name.

8. THEATER:It gives all the details of the theater.
    - T_ID:Theater unique id.
    - NAME:Name of the theater.
    - ADDRESS:Address of the theater.
    - PLACE:City of the theater.
    - STATE:State of the theater.
    - PIN :Pin code of the place

Results with Screen-Shots

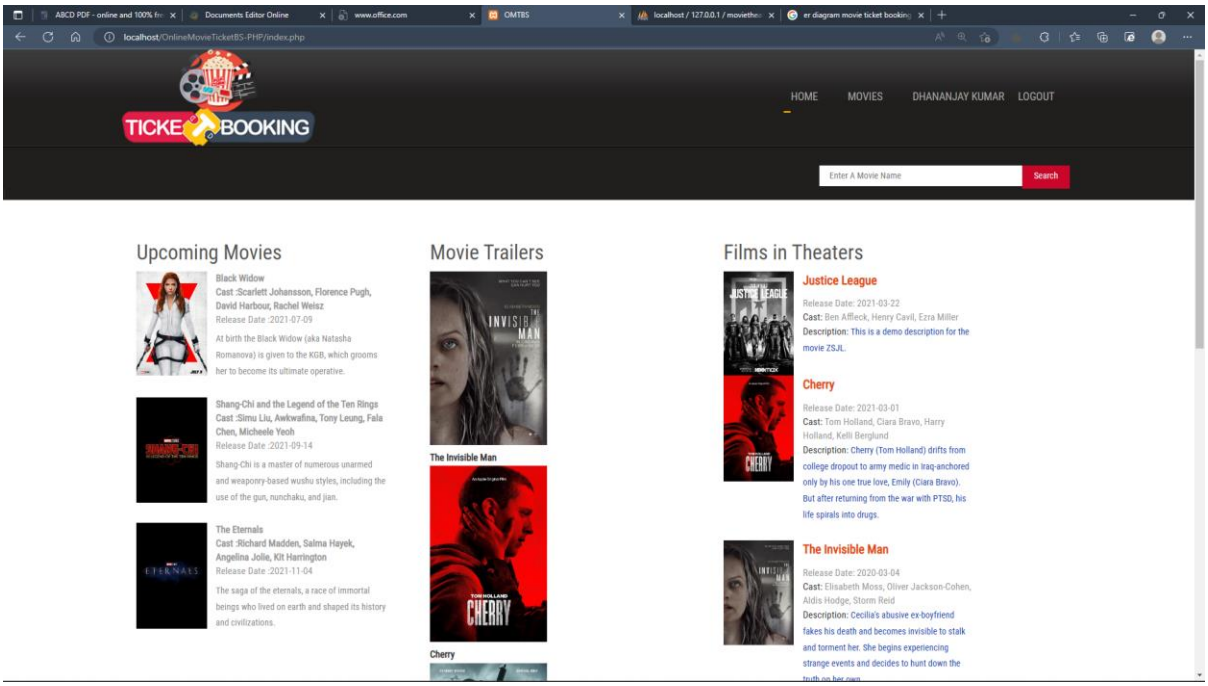

Fig. 5.1 Home Page

Fig 5.1 Indicates the home page of our BOOKING website . This contains navigation bar, through which can navigate to other pages. It also contains some details about the website at the home page.

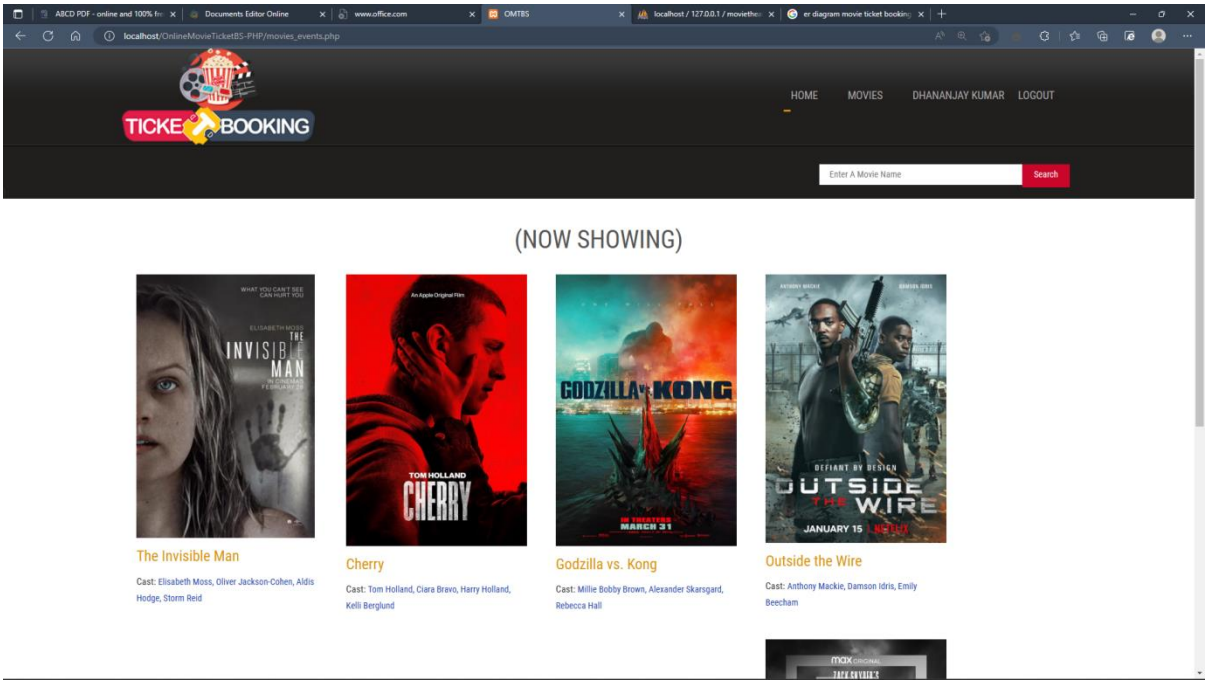

Fig. 5.2 M o v i e page

Fig 5.2 This page consists of Movies. This contains navigation bar, through which can navigate to other pages.

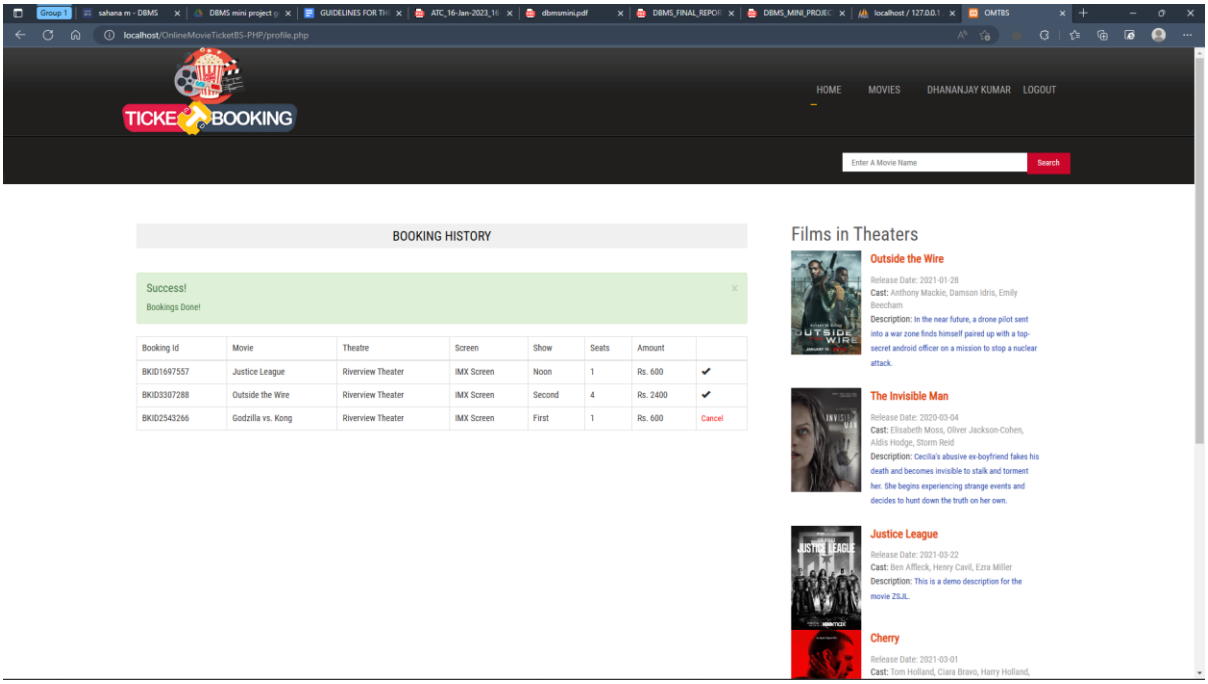

Fig 5.3 User Profile page

Fig 5.3 Indicates user login page. It displays all the movie bookings made by the particular user.

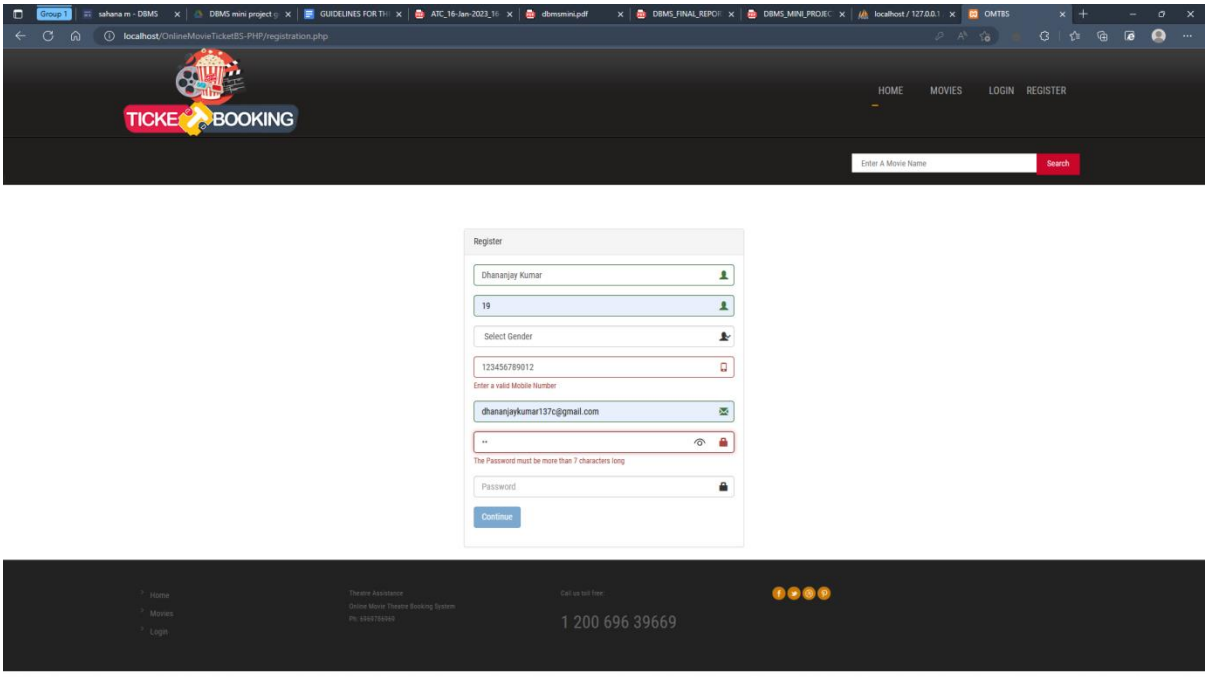

Fig 5.4 Registration page

Fig 5.4 This is register page on which a user can make his/her account for booking movie tickets. New users must enter name, email ,gender,password.

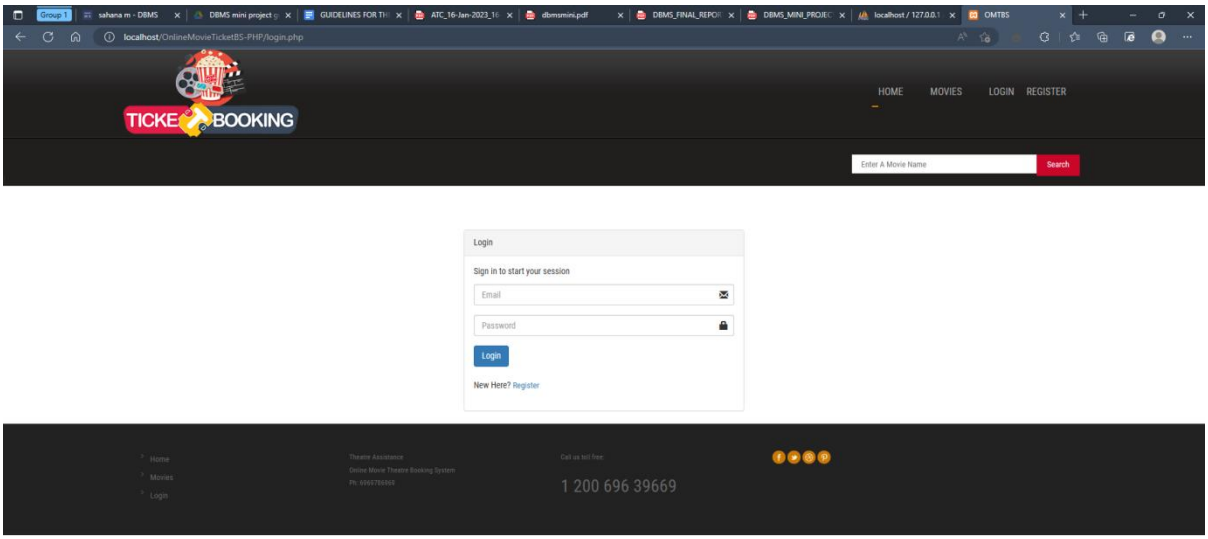

Fig 5.5 Login Page

Fig 5.5 For the ones who have created there account by registering , this is login page , by just entering email-id and password

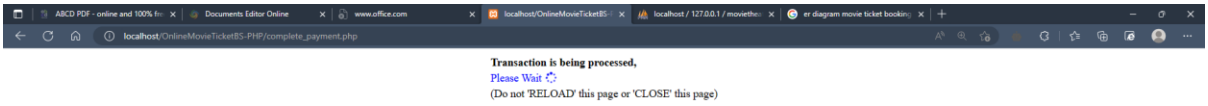

Fig 5.6 Processing Payment page

Fig 5.6 Indicates Payment processing page. It redirects to the user profile page, if the payment is successful otherwise payment failed message

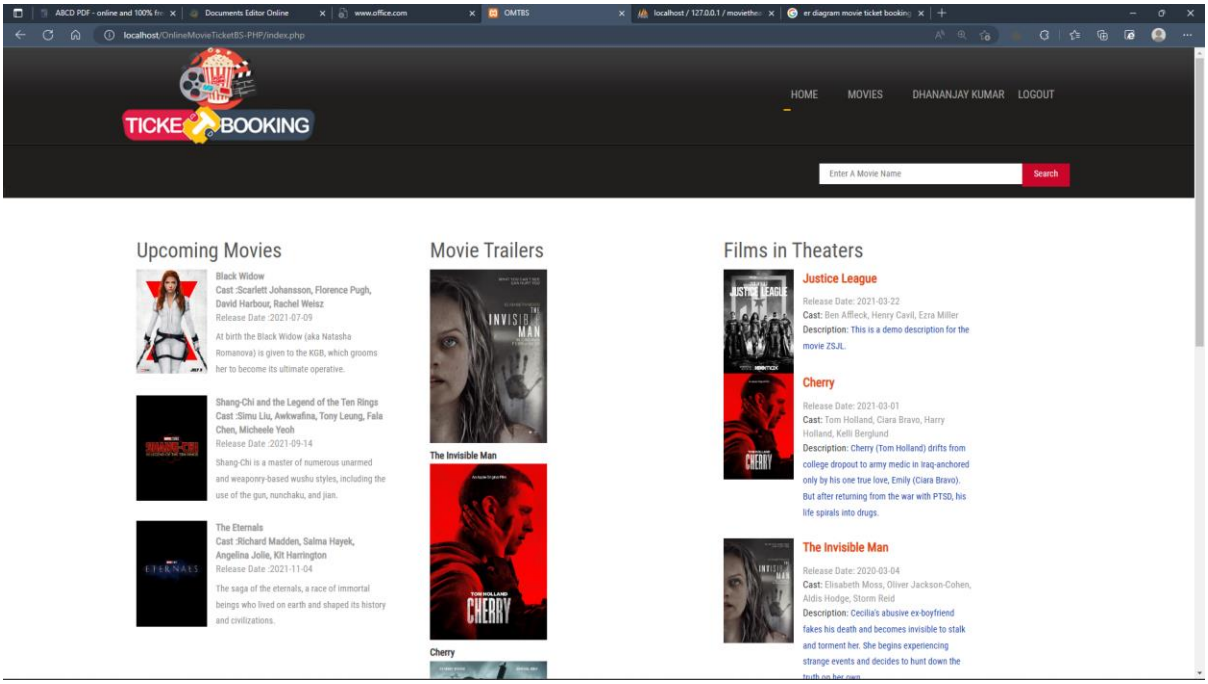

Fig 5.7 Admin page

Fig 5.7 Indicates Admin page. This cannot be login by any means by any means untill unless, one knows admin password and id.

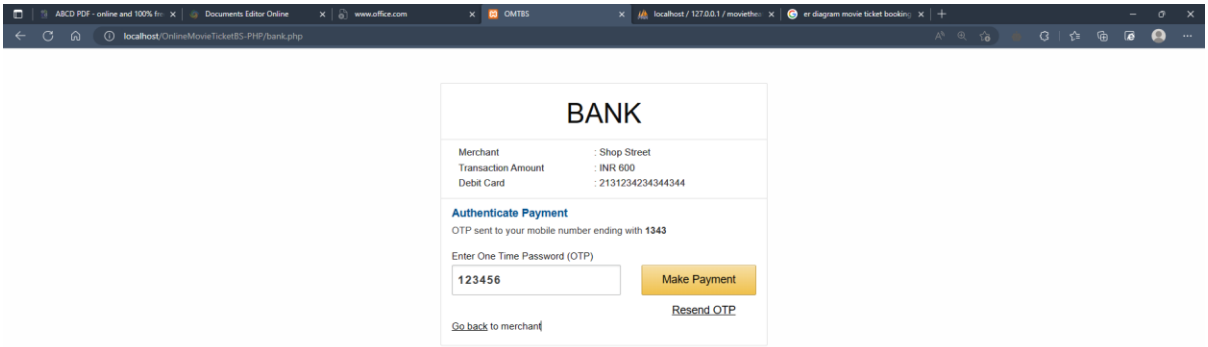

Fig 5.8 Payment page

Fig 5.8 Indicates payment page. User must Enter the otp to finalize the payment and book their Respective ticket.

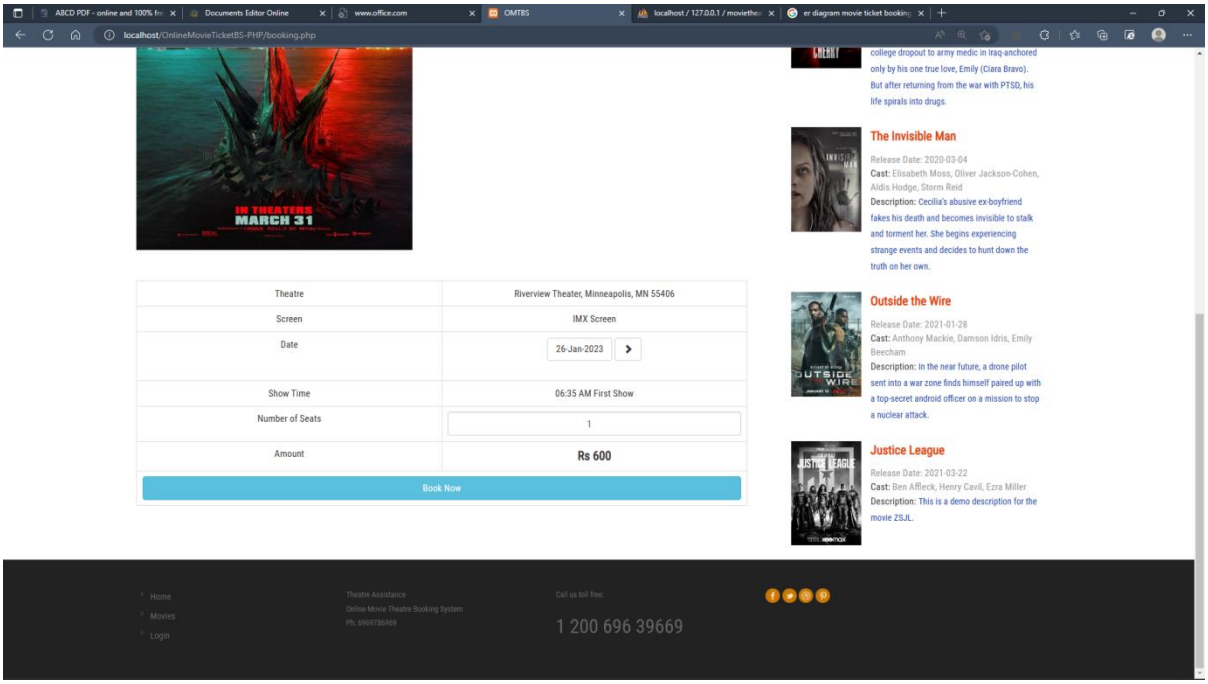

Fig 5.9 Booking page

Fig 5.9 Indicates Booking page. Select date, no of seats to book and timing along with , it displays the location of the theater.

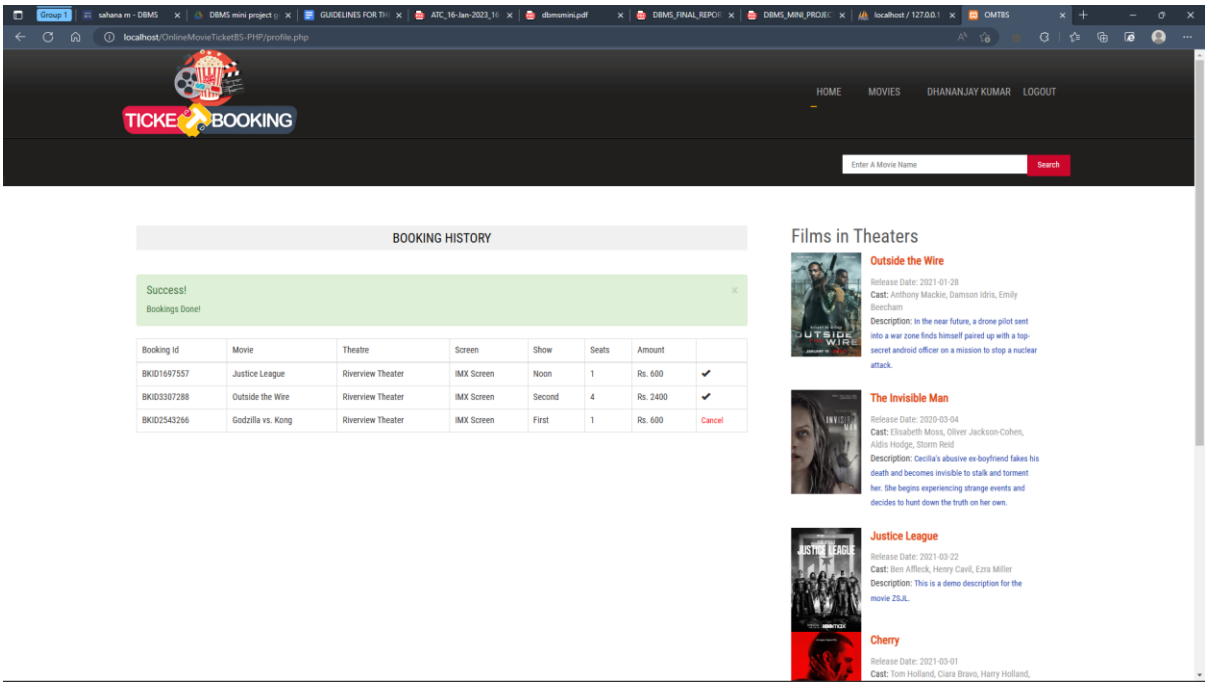

Fig 5.10 Payment Success page

Fig 5.10 This is Payment successful page . If the payment is successful then user profile page Opened and all the bookings are displayed along with the history.

Conclusion

In conclusion, a Online movie ticket booking management system is a powerful tool that can help businesses streamline their operations and improve their bottom line. The system provides a centralized location for managing the booking movie tickets. The system canhelp businesses to improve their inventory management, streamlined billing, better customer hospitality, and increase efficiency which ultimately leads for increased revenue. The system canbe used by a variety of different businesses, such as movie promotion , actor advertisement. It can also be used by organizations that provide tickets to employeesor students on a temporary basis. With the help of a online movie ticket booking management system, businesses can improve their operations, increase revenue, and provide better service to their customers. Online Movie Ticket Booking Management System is user-friendly and customized software for a movie ticket booking company. Online Movie ticket Booking Management System has been developed to manage and automate the overall processing of any Theater for movie promotions and all with company collaboration It is a user friendly and customized software for providing support for companyadmin. This project is a very flexible software and it can be upgraded according to the individual needs.

Future Enhancement

As people need rest time, or person who wants to some break from his daily work can watch movie and this thing can have a significant effect on how much work gets done in the office. Buyingan extra movie tickets often makes sense in case any of our family members want to watch a movie with you or any last minute friend. However, if a theater also pay a big role int this, finding a less costly alternative is essential. Booking services provide a convenient solution for increased short-term requirements.The online booking service can also be used for many other reasons like booking hotels , theaters along with Computers can be rented on a daily, weekly, or monthly basis, depending on your business's needs.
